

UAS Lidar Elevation Corrections in Mangals Using Machine Learning

Ali Gonzalez Perez, PSM.,

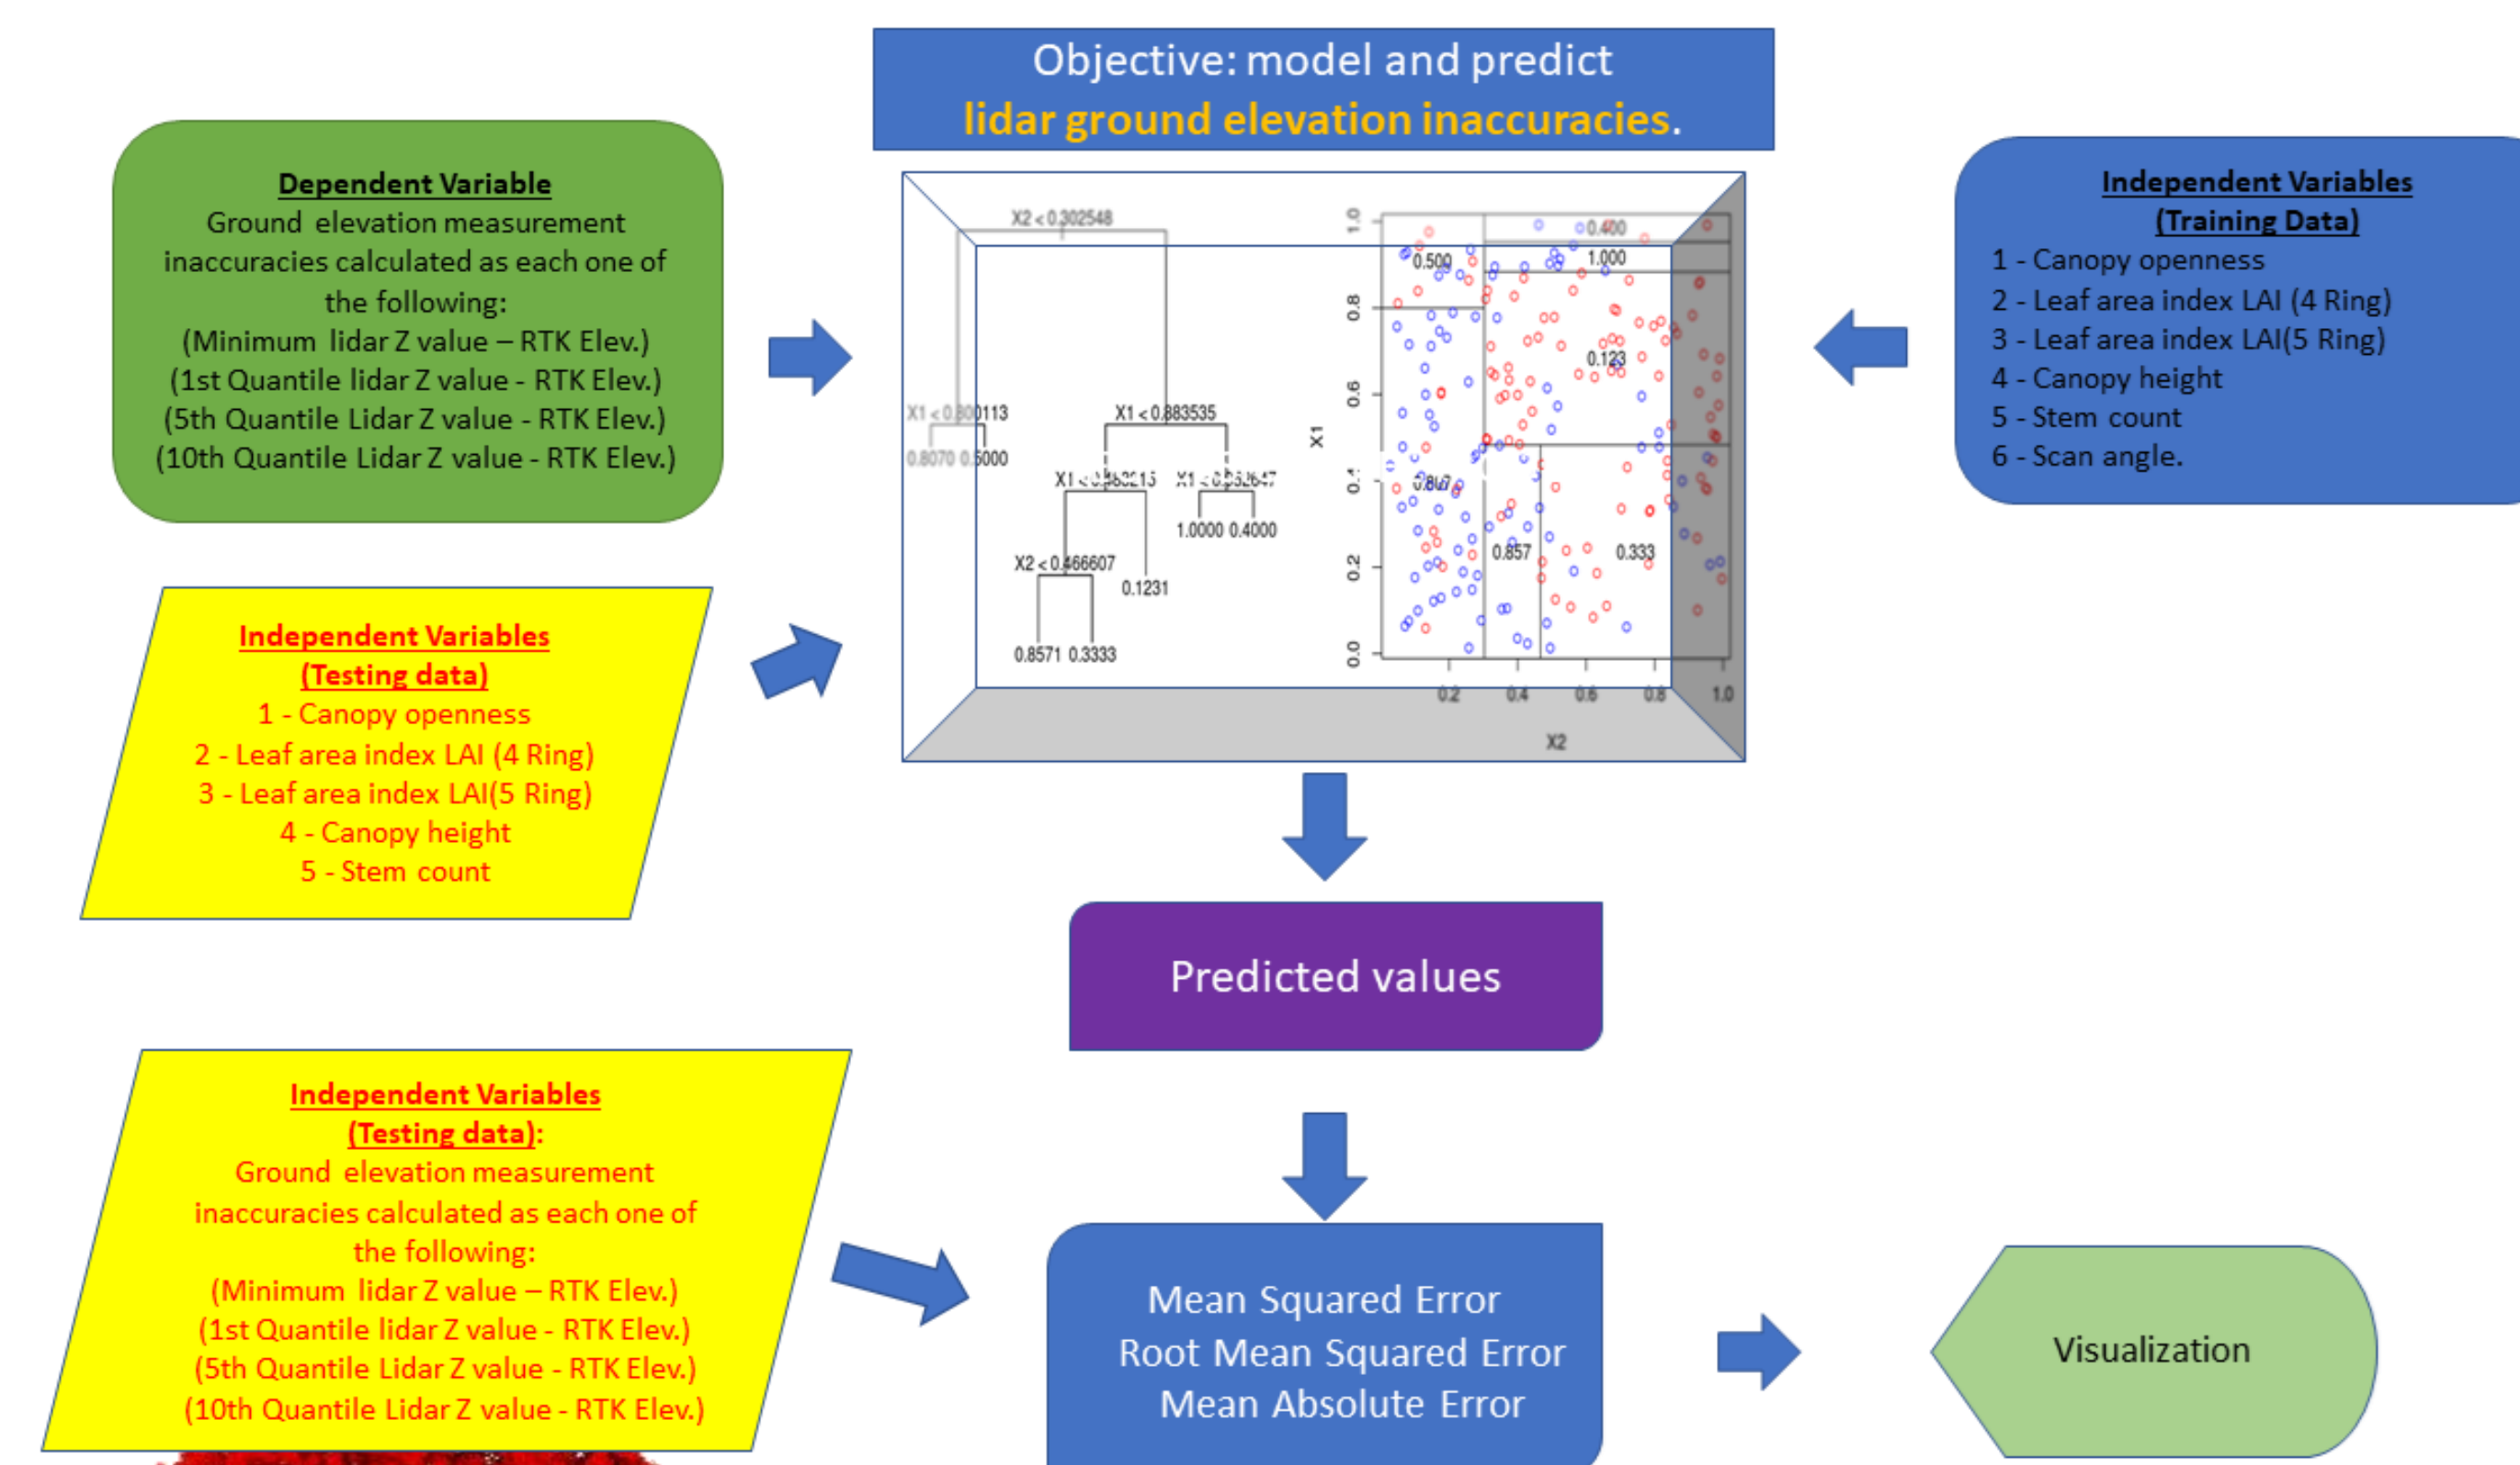

Amr Abd-Elrahman, Ph.D., Benjamin Wilkinson, Ph. D., University of Florida, Plant City, Florida

Introduction

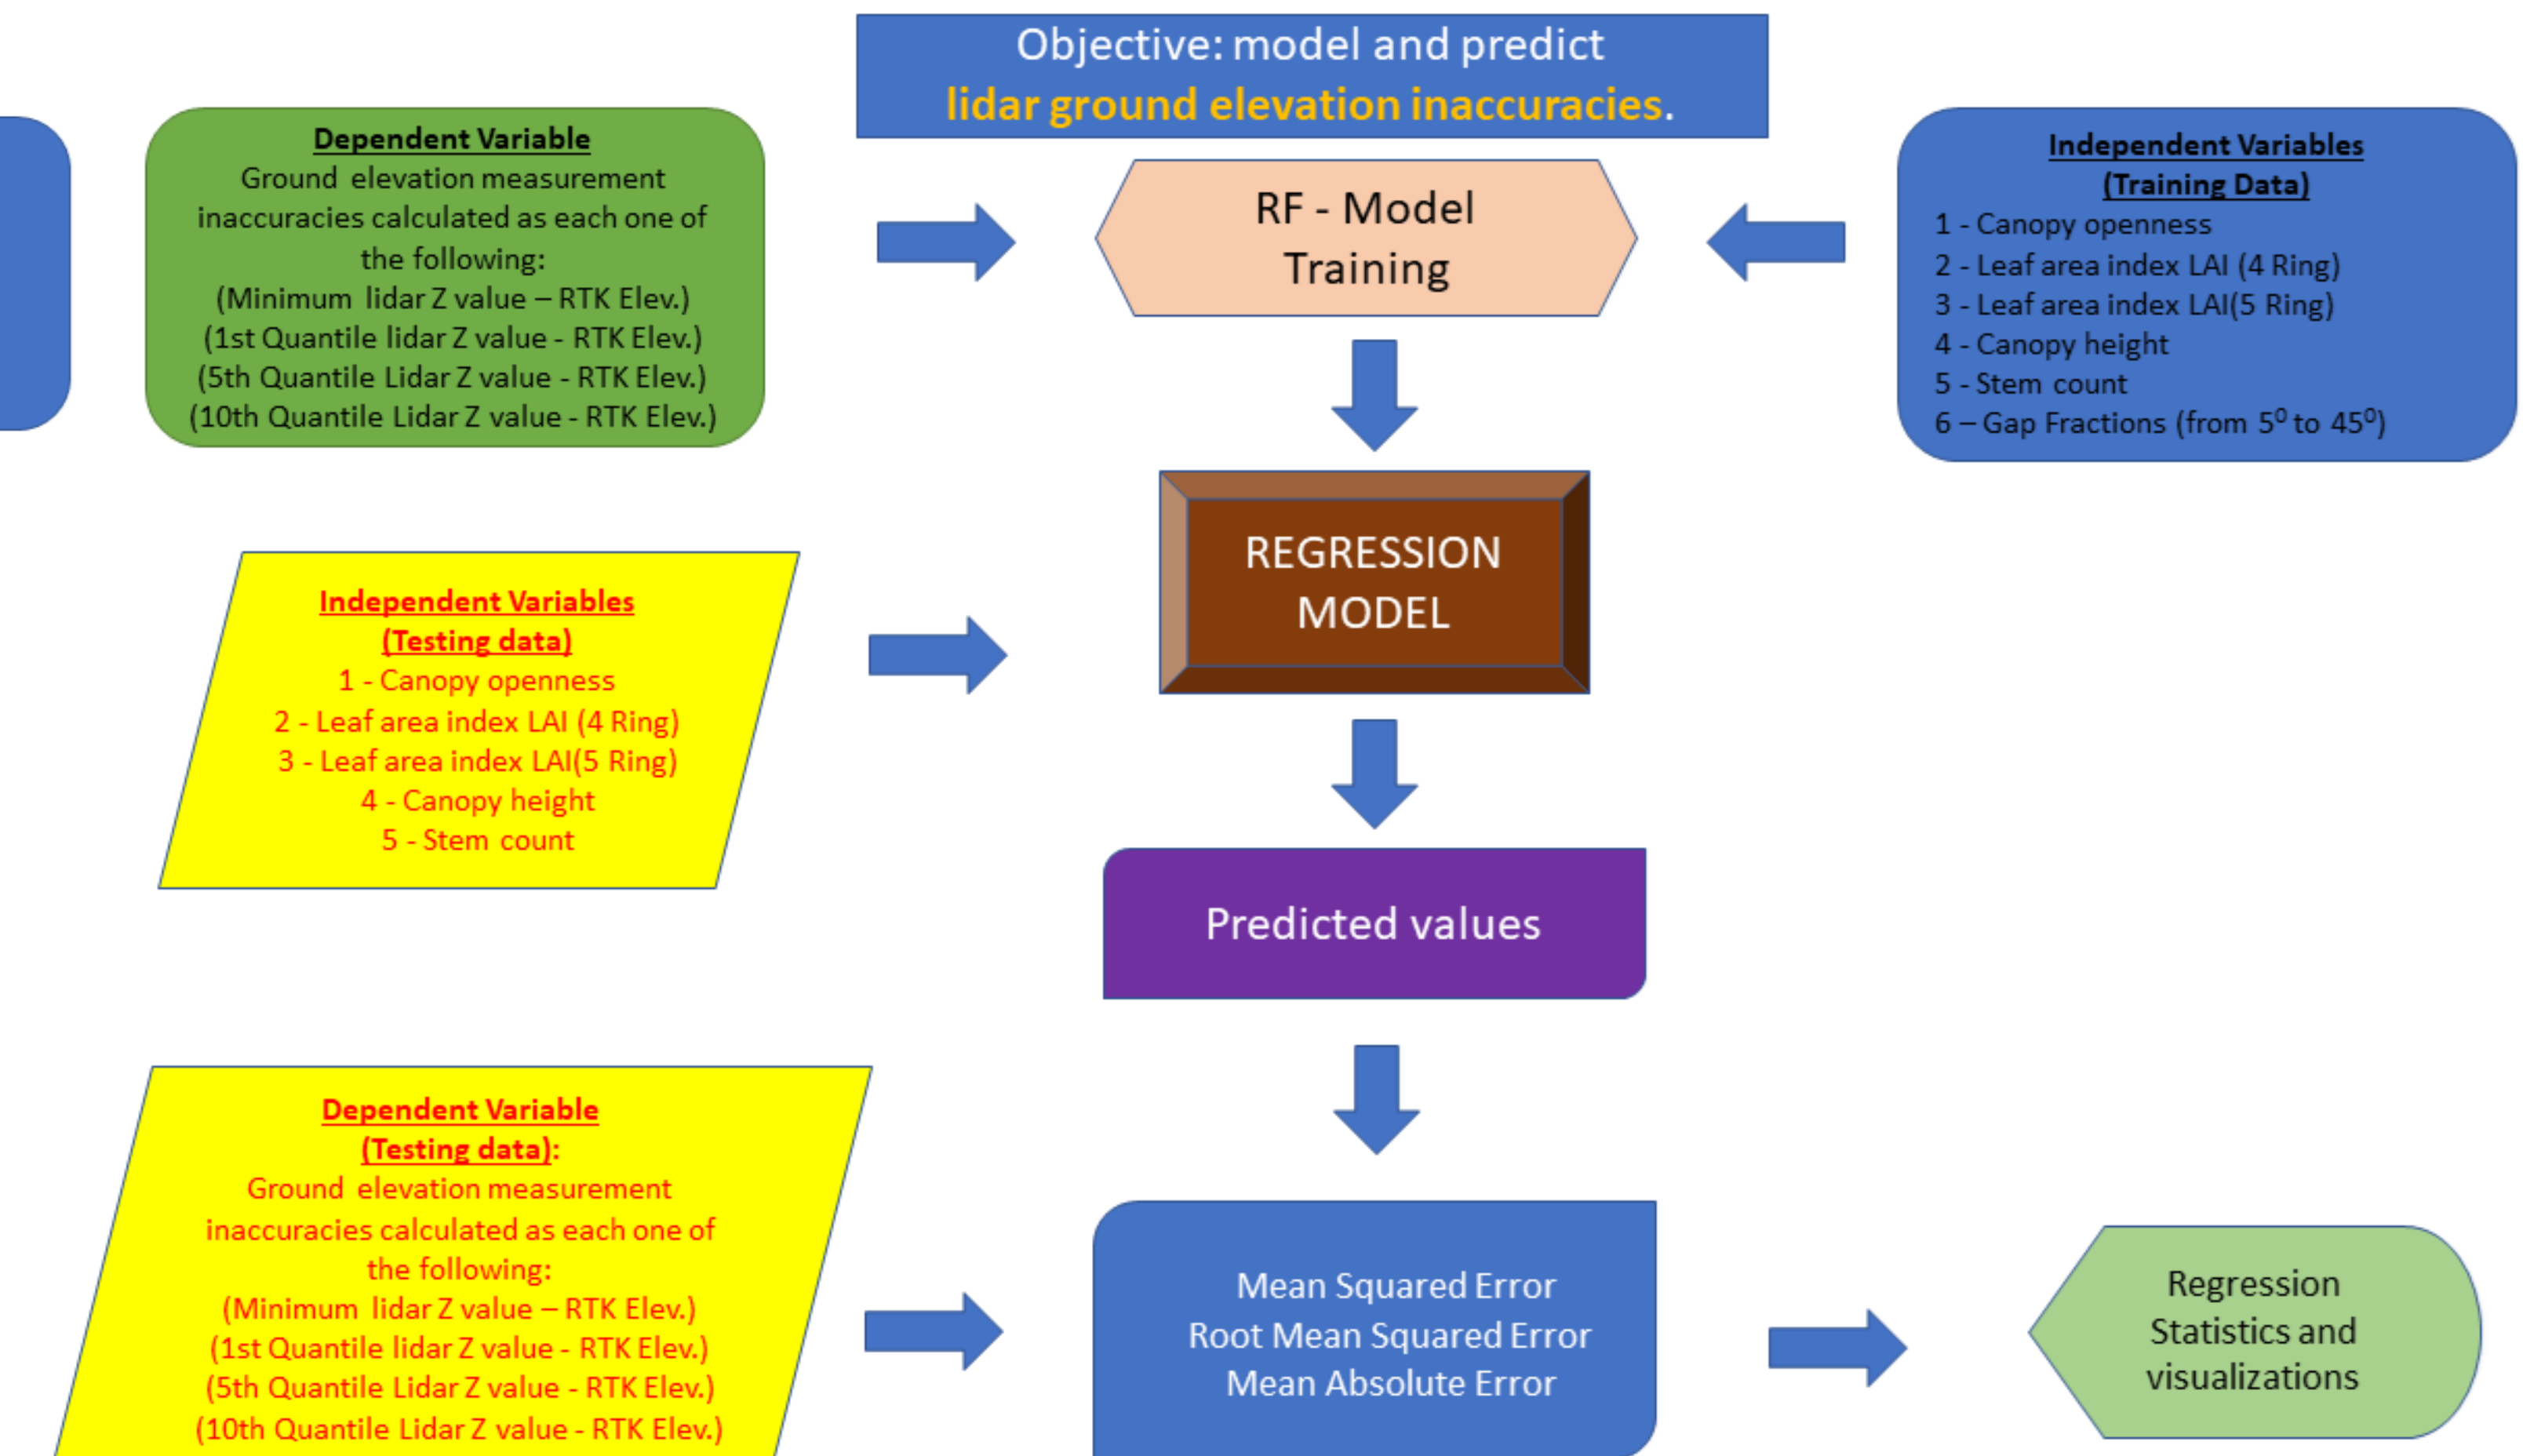

- Lidar can acquire **geospatial information** of a coastal zone with high accuracy, but must be used with caution
- The presence of mangroves presents unique challenges for creating accurate lidar digital products.
- The accuracy of the elevation measurements directly affects coastal monitoring and restoration.

Approach: Decision Trees. *Factors affecting measurements*

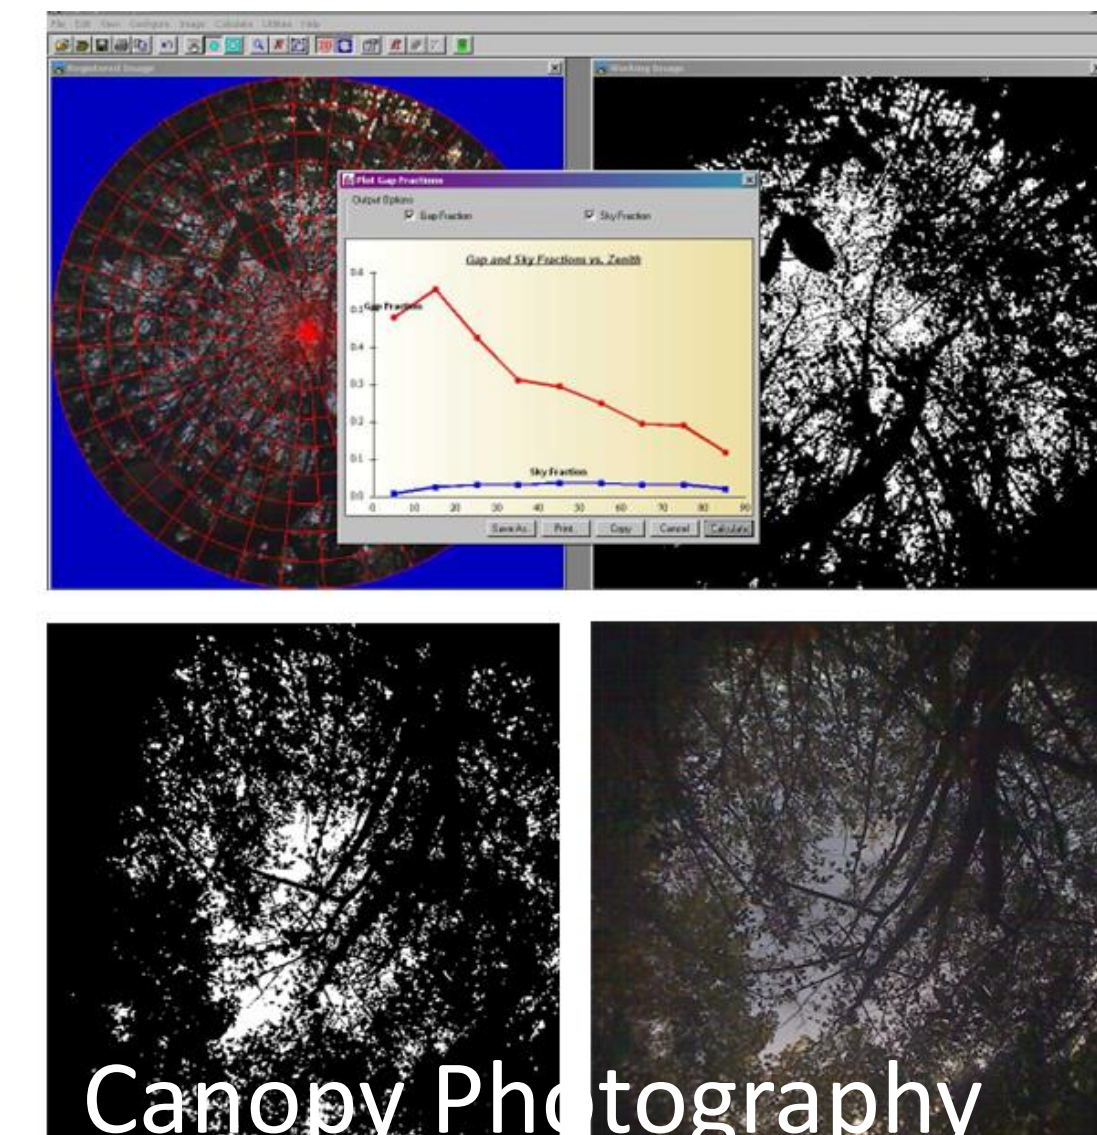

Approach: Random Forest Regression. *Correction model*

UAS Survey

Ground Survey

Expected Results

- Compilation of the key factors influencing UAS lidar elevation beneath canopies.
- Determination of coefficients required to adjust UAS lidar based canopy traits
- Identification of coefficients for correcting UAS cloud elevation using lidar metrics
- Determination of the impact of the lidar angle of incidence on elevation through canopies.
